Instructions for Using the \LaTeX\ 2ε Class for Proceedings Papers

LLNCS, Version 2.20, Mar 10, 2018

1 Working with the LLNCS Document Class

1.1 General Information

The LLNCS class is an extension of the standard \LaTeX\ “article” class. Therefore you may use all “article” commands in your manuscript.

If you are already familiar with \LaTeX, the LLNCS class should not give you any major difficulties. It basically adjusts the layout to the required standard, defining styles and spacing of headings and captions and setting the printing area to 122 mm horizontally by 193 mm vertically. To keep the layout consistent, we kindly ask you to refrain from using any \LaTeX\ command that modifies these settings (i.e. `\textheight`, `\vspace`, `\baselineskip`, etc.). Such manual layout adjustments should be limited to very exceptional cases.

In addition to defining the general layout, the LLNCS document class provides some special commands for typesetting the contribution header, i.e. title, authors, affiliations, abstract, and additional metadata. These special commands are described in Sect. 2.

For a more detailed description of how to prepare your text, illustrations, and references, see the Springer Guidelines for Authors of Proceedings.

1.2 How to Use the LLNCS Document Class

The LLNCS class is invoked by replacing “article” by “llncs” in the first line of your \LaTeX\ document:

\begin{verbatim}
\documentclass{llncs}
\begin{document}
<Your contribution>
\end{document}
\end{verbatim}

If your file is already coded with \LaTeX, you can easily adapt it to the LLNCS document class by replacing

\begin{verbatim}
\documentclass{article}
\end{verbatim}

with

\begin{verbatim}
\documentclass{llncs}
\end{verbatim}
2 How to Code the Header of Your Paper

2.1 Title

\texttt{\textbackslash title} Please code the title of your contribution as follows:

\texttt{\textbackslash title\{<Your contribution title>\}}

All words in titles should be capitalized except for conjunctions, prepositions (e.g. on, of, by, and, or, but, from, with, without, under), and definite/indefinite articles (the, a, an), unless they appear at the beginning. Formula letters are typeset as in the text. Long titles that run over multiple lines can be wrapped explicitly with \textbackslash. Titles have no end punctuation.

Acknowledgements should generally be placed in an unnumbered subsection at the end of the paper. If you still need to refer to a support or funding program in a note to the title, you can use the\texttt{\textbackslash thanks} macro inside the title:

\texttt{\textbackslash title\{<Your contribution title>\textbackslash thanks\{<granted by x>\}\}}

Please do not use \texttt{\textbackslash thanks} inside \texttt{\textbackslash author} or \texttt{\textbackslash institute} as footnotes for these elements are not supported in the online version and will therefore be dropped.

\texttt{\textbackslash fnmsep} If you need two or more footnotes please separate them with \texttt{\textbackslash fnmsep} (i.e. footnote mark separator).

\texttt{\textbackslash titlerunning} If a long title does not fit in the single line of the running head, a warning is generated. You can specify an abbreviated title for the running head with the command

\texttt{\textbackslash titlerunning\{<Your abbreviated contribution title>\}}

\texttt{\textbackslash subtitle} An optional subtitle may also be added:

\texttt{\textbackslash subtitle\{<subtitle of your contribution>\}}

2.2 Author(s)

\texttt{\textbackslash author} The name(s) of the author(s) are specified by:

\texttt{\textbackslash author\{<author(s) name(s)>\}}

\texttt{\textbackslash and} If there is more than one author, please separate them by \texttt{\textbackslash and}. This makes sure that correct punctuation is inserted according to the number of authors.

\texttt{\textbackslash inst} Numbers referring to different addresses or affiliations should be attached to each author with the \texttt{\textbackslash inst\{<number>\}} command. If an author is affiliated with multiple institutions the numbers should be separated by a comma, for example \texttt{\textbackslash inst\{2,3\}}.

\texttt{\textbackslash orcidID} ORCID identifiers can be included with

\texttt{\textbackslash orcidID\{<ORCID identifier>\}}
The ORCID (Open Researcher and Contributor ID) registry provides authors with unique digital identifiers that distinguish them from other researchers and help them link their research activities to these identifiers. Authors who are not yet registered with ORCID are encouraged to apply for an individual ORCID id at [https://www.orcid.org](https://www.orcid.org) and to include it in their papers. In the final publication, the ORCID id will be replaced by an ORCID icon 🆕, which will link from the eBook to the actual ID in the ORCID database. The ORCID icon will also replace the number in the printed book.

If you have done this correctly, the author line now reads, for example:

```latex
\author{First Author\inst{1}\orcidID{0000-1111-2222-3333} \and
Second Author\inst{2,3}\orcidID{1111-2222-3333-4444}}
```

The given name(s) should always be followed by the family name(s). Authors who have more than one family name should indicate which part of their name represents the family name(s), for example by non-breaking spaces \textit{José} Martinez-Perez or curly braces \textit{José} \{Martinez Perez\}.

\textbf{Author running} As given name(s) are to be shortened to initials in the running heads, specifying an abbreviated author list with the optional command:

```latex
\authorrunning{<abbreviated author list>}
```

might add some clarity about the correct representation of author names, in the running-heads as well as in the author index.

\section{2.3 Affiliations}

\texttt{\textbackslash institute} Addresses of institutes, companies, etc. should be given in \texttt{\textbackslash institute}.

\texttt{\textbackslash and} Multiple affiliations are separated by \texttt{\textbackslash and}, which automatically assures correct numbering:

```latex
\institute{<name of an institute>
\and <name of the next institute>
\and <name of the next institute>}
```

\texttt{\textbackslash email} Inside \texttt{\textbackslash institute} you can use

```latex
\email{<email address>}
```

\texttt{\textbackslash url} and

```latex
\url{<url>}
```

to provide author email addresses and Web pages. If you need to typeset the tilde character – e.g. for your Web page in your unix system’s home directory – the \texttt{\textbackslash homedir} command will do this. If multiple authors have the same affiliation, please check that the order of email addresses matches the sequence of (affiliated) author names.

Please note that, if email addresses are given in your paper, they will also be included in the metadata of the online version.
2.4 Format the Header

\maketitle The command \maketitle formats the header of your paper. If you leave it out the work done so far will produce no text.

2.5 Abstract and Keywords

\abstract The abstract is coded as follows:
\begin{abstract}
<Text of the summary of your paper>
\end{abstract}
\keywords Keywords should be specified inside the \abstract environment. Please capitalize the first letter of each keyword and again separate them with \and:
\keywords{First keyword \and Second keyword \and Third keyword}

The keyword separator will then be properly rendered as a middle dot.

3 How to Code the Body of Your Paper

3.1 General Rules

From a technical point of view, the LLNCS document class does not require any specific LaTeX coding in the body of your paper. You can simply use the commands provided by the ‘article’ document class. For more information about what will be done with your manuscript before publication, please refer to the Springer Guidelines for Authors of Proceedings.

3.2 Special Math Characters

The LLNCS document class supports some additional special characters:
\grole yields \geq \getsto yields \leq
\lid yields \leq \gid yields \geq

If you need blackboard bold characters, i.e. for sets of numbers, please load the related \texttt{AMS-\LaTeX} fonts. If for some reason this is not possible you can also use the following commands from the LLNCS class:
\bbbc yields \mathbb{C} \ bbbf yields \mathbb{F}
\bbbh yields \mathbb{H} \ bbbk yields \mathbb{K}
\bbbm yields \mathbb{M} \ bbbn yields \mathbb{N}
\bbbp yields \mathbb{P} \ bbqq yields \mathbb{Q}
\bbbr yields \mathbb{R} \ bbbs yields \mathbb{S}
\bbbt yields \mathbb{T} \ bbzb yields \mathbb{Z}
\bbbone yields \mathbb{1}

Please note that all these characters are only available in math mode.
4 Theorems, Definitions, and Proofs

4.1 Predefined Theorem-Like Environments

Several theorem-like environments are predefined in the LLNCS document class. The following environments have a bold run-in heading, while the following text is in italics:

- \begin{corollary} <text> \end{corollary}
- \begin{definition} <text> \end{definition}
- \begin{lemma} <text> \end{lemma}
- \begin{proposition} <text> \end{proposition}
- \begin{theorem} <text> \end{theorem}

Other theorem-like environments render the text in roman, while the run-in heading is bold as well:

- \begin{case} <text> \end{case}
- \begin{conjecture} <text> \end{conjecture}
- \begin{example} <text> \end{example}
- \begin{exercise} <text> \end{exercise}
- \begin{note} <text> \end{note}
- \begin{problem} <text> \end{problem}
- \begin{property} <text> \end{property}
- \begin{question} <text> \end{question}
- \begin{remark} <text> \end{remark}
- \begin{solution} <text> \end{solution}

Finally, there are also two unnumbered environments that have the run-in heading in italics and the text in upright roman.

- \begin{claim} <text> \end{claim}
- \begin{proof} <text> \end{proof}

Proofs may contain an eye catching square, which can be inserted with \qedsymbol before the environment ends.

4.2 User-Defined Theorem-Like Environments

We have enhanced the standard \texttt{newtheorem} command and slightly changed its syntax to get two new commands \texttt{spnewtheorem} and \texttt{spnewtheorem*} that now can be used to define additional environments. They require two additional arguments, namely the font style of the label and the font style of the text of the new environment:

\texttt{\spnewtheorem{<env_nam>}[<num_like>]{<caption>}{<cap_font>}{<body_font>}}

For example,

\texttt{\spnewtheorem*{maintheorem}{theorem}{Main Theorem}{\bfseries}{\itshape}}
will create a main theorem environment that is numbered together with the predefined theorem. The sharing of the default counter ([theorem]) is desired. If you omit the optional second argument of \spnewtheorem, a separate counter for your new environment is used throughout your document.

In combination with the (obsolete) class option envcountsect (see. Sect. 5), the \spnewtheorem command also supports the syntax:

\spnewtheorem{<env_nam>}{<caption>}{<within>}{<cap_font>}{<body_font>}

With the parameter <within>, you can control the sectioning element that resets the theorem counters. If you specify, for example, subsection, the newly defined environment is numbered subsectionwise.

If you wish to add an unnumbered environment, please use the syntax

\spnewtheorem*{<env_nam>}{<caption>}{<cap_font>}{<body_font>}

5 References

There are three options for citing references:

– arabic numbers, i.e. [1], [3–5], [4–6,9],
– labels, i.e. [CE1], [AB1.XY2],
– author/year system, (Smith et al. 2000), (Miller 1999a, 12; Brown 2018).

We prefer citations with arabic numbers, i.e. the usage of \bibitem without an optional parameter. If you want to use the author/year system, please specify the class option citeauthoryear, i.e.

\documentclass[citeauthoryear]{llncs}

splncs04.bst We encourage you to use Bib\TeX for typesetting your references. For formatting the bibliography according to Springer’s standard (for mathematics, physical sciences, and computer science), please use the bibliography style file splncs04.bst that comes with the LLNCS document class. You simply need to add \bibliographystyle{splncs04} to your document. DOIs should be provided in the doi field of your .bib database. Bib\TeX will then automatically add them to your references.

\doi If you do not use Bib\TeX, you can include a DOI with the \doi command:

\doi{<DOI>}

The DOI will be expanded to the URL https://doi.org/<DOI> in accordance with the CrossRef guidelines.

6 Obsolete Class Options

The LLNCS document class contains several class options that have become obsolete over the years. We only mention them for completeness:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>orivec</code></td>
<td>The LLNCS document class changes the formatting of vectors coded with <code>\vec</code> to boldface italics. If you absolutely need the original \TeX design for vectors, i.e. an arrow above the related variable, you can restore it with the <code>orivec</code> option.</td>
</tr>
<tr>
<td><code>envcountsame</code></td>
<td>All theorem-like environments share one counter, i.e. Theorem 1, Lemma 2, Corollary 3, etc.</td>
</tr>
<tr>
<td><code>envcountreset</code></td>
<td>All theorem-like environments are numbered per section, i.e. the related counters are reset to 1 in every section.</td>
</tr>
<tr>
<td><code>envcountsect</code></td>
<td>All theorem-like environments are numbered per section, and the section number added to the individual counter, i.e. Theorem 1.2, Lemma 2.2, etc.</td>
</tr>
<tr>
<td><code>openbib</code></td>
<td>This option produces the “open” bibliography style, in which each block starts on a new line, and succeeding lines in a block are indented by <code>\bibindent</code>.</td>
</tr>
<tr>
<td><code>oribibl</code></td>
<td>This option restores the original \TeX definitions for the bibliography and the <code>\cite</code> mechanism that some Bib\TeX applications rely on.</td>
</tr>
</tbody>
</table>
