

# Decoding Random Binary Linear Codes in $2^{n/20}$

How  $1+1=0$  Improves Information Set Decoding

A. Becker, A. Joux, A. May, [A. Meurer](#)

EUROCRYPT 2012, Cambridge

## How to find a needle N in a haystack H...

- Expand H into larger stack H'
- Expanding H' introduces r many representations  $N_1, \dots, N_r$
- Examine a  $1/r$  – fraction of H' to find one  $N_i$

## How to find a needle N in a haystack H...

- Expand H into larger stack H'
- Expanding H' introduces r many representations  $N_1, \dots, N_r$
- Examine a  $1/r$  – fraction of H' to find one  $N_i$

Technicality: Find a way to examine a  $1/r$  – fraction of H' without completely constructing it beforehand

## How to find a needle N in a haystack H...

- Expand H into larger stack H'
- Expanding H' introduces r many representations  $N_1, \dots, N_r$
- Examine a  $1/r$  – fraction of H' to find one  $N_i$

Technicality: Find a way to examine a  $1/r$  – fraction of H' without completely constructing it beforehand

Has been used in [MMT11] to improve Information Set Decoding

## Optimizing the Representation Technique [BCJ11]

- $r$  = number of needles
  - $|H'|$  = size of expanded haystack
  - Ratio  $|H'| / r$  determines efficiency
- **Increase  $r$  while keeping  $|H'|$  small**

## Optimizing the Representation Technique [BCJ11]

- $r$  = number of needles
  - $|H'|$  = size of expanded haystack
  - Ratio  $|H'| / r$  determines efficiency
- **Increase  $r$  while keeping  $|H'|$  small**

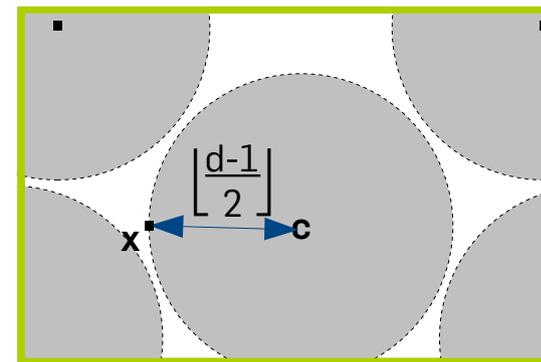

Can we use  $1+1 = 0$  to increase  $r$  ?

# Recap Binary Linear Codes

- $C$  = random binary  $[n,k,d]$  code
- $n$  = length /  $k$  = dimension /  $d$  = minimum distance

## Bounded Distance Decoding (BDD)

- Given  $\mathbf{x} = \mathbf{c} + \mathbf{e}$  with  $\mathbf{c} \in C$   
and  $w := \text{wt}(\mathbf{e}) = \lfloor \frac{d-1}{2} \rfloor$
- Find  $\mathbf{e}$  and thus  $\mathbf{c} = \mathbf{x} + \mathbf{e}$

## How to compare performance of decoding algorithms

- Running time  $T(n,k,d)$
- Fixed code rate  $R = k/n$
- For  $n \rightarrow \infty$ ,  $k$  and  $d$  are related via [Gilbert-Varshamov bound](#), thus

$$T(n,k,d) = T(n,k)$$

- Compare algorithms by [complexity coefficient](#)  $F(k)$ , i.e.

$$T(n,k) = 2^{F(k) \cdot n + o(n)}$$

## How to compare performance

- Running time  $T(n,k,d)$
- Fixed code rate  $R = k/n$
- For  $n \rightarrow \infty$ ,  $k$  and  $d$  are related via the Gilbert-Varshamov bound, thus

$$T(n,k,d) = T(n,k)$$

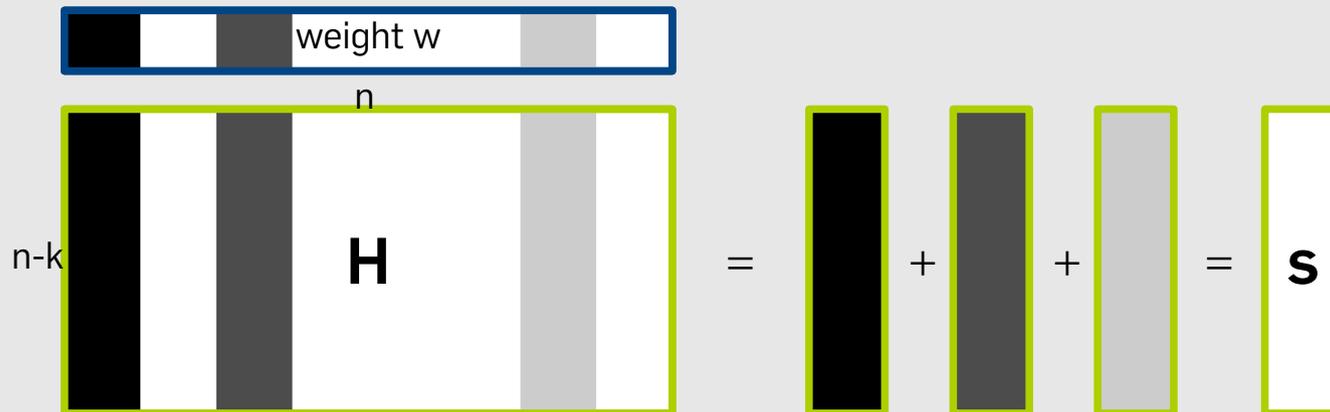

- Compare algorithms by complexity coefficient  $F(k)$ , i.e.

$$T(n,k) = 2^{F(k) \cdot n + o(n)}$$

**Minimize  $F(k)$ !**

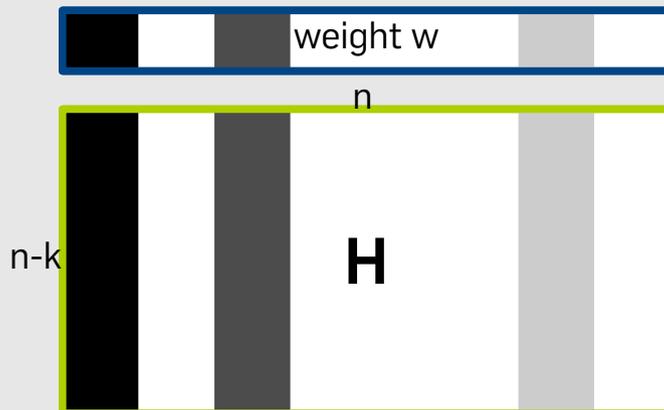

(BDD) Given  $\mathbf{x} = \mathbf{c} + \mathbf{e}$  with  $\mathbf{c} \in \mathcal{C}$  and  $\text{wt}(\mathbf{e}) = w$ , find  $\mathbf{e}$ !

- $\mathbf{H}$  = parity check matrix
  - Consider **syndrome**  $\mathbf{s} := s(\mathbf{x}) = \mathbf{H} \cdot \mathbf{x} = \mathbf{H} \cdot (\mathbf{c} + \mathbf{e}) = \mathbf{H} \cdot \mathbf{e}$
- Find **linear combination** of  $w$  columns of  $\mathbf{H}$  matching  $\mathbf{s}$

(BDD) Given  $\mathbf{x} = \mathbf{c} + \mathbf{e}$  with  $\mathbf{c} \in \mathcal{C}$  and  $\text{wt}(\mathbf{e}) = w$ , find  $\mathbf{e}$ !

- $\mathbf{H}$  = parity check matrix
  - Consider **syndrome**  $\mathbf{s} := s(\mathbf{x}) = \mathbf{H} \cdot \mathbf{x} = \mathbf{H} \cdot (\mathbf{c} + \mathbf{e}) = \mathbf{H} \cdot \mathbf{e}$
- Find **linear combination** of  $w$  columns of  $\mathbf{H}$  matching  $\mathbf{s}$

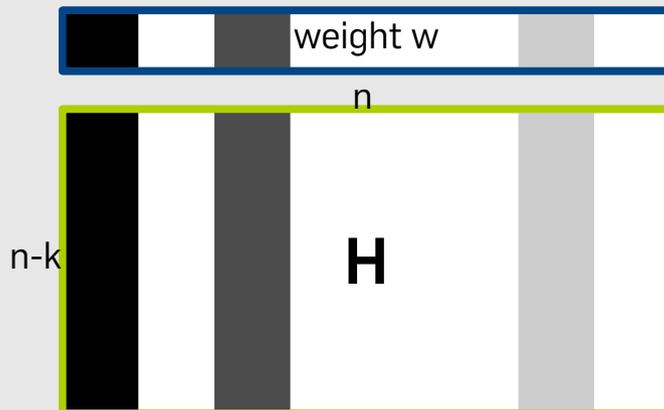

**Brute-Force** complexity

$$T(n, k, d) = \binom{n}{w}$$

(BDD) Given  $\mathbf{x} = \mathbf{c} + \mathbf{e}$  with  $\mathbf{c} \in \mathcal{C}$  and  $\text{wt}(\mathbf{e}) = w$ , find  $\mathbf{e}$ !

- $\mathbf{H}$  = parity check matrix
  - Consider **syndrome**  $\mathbf{s} := s(\mathbf{x}) = \mathbf{H} \cdot \mathbf{x} = \mathbf{H} \cdot (\mathbf{c} + \mathbf{e}) = \mathbf{H} \cdot \mathbf{e}$
- Find **linear combination** of  $w$  columns of  $\mathbf{H}$  matching  $\mathbf{s}$

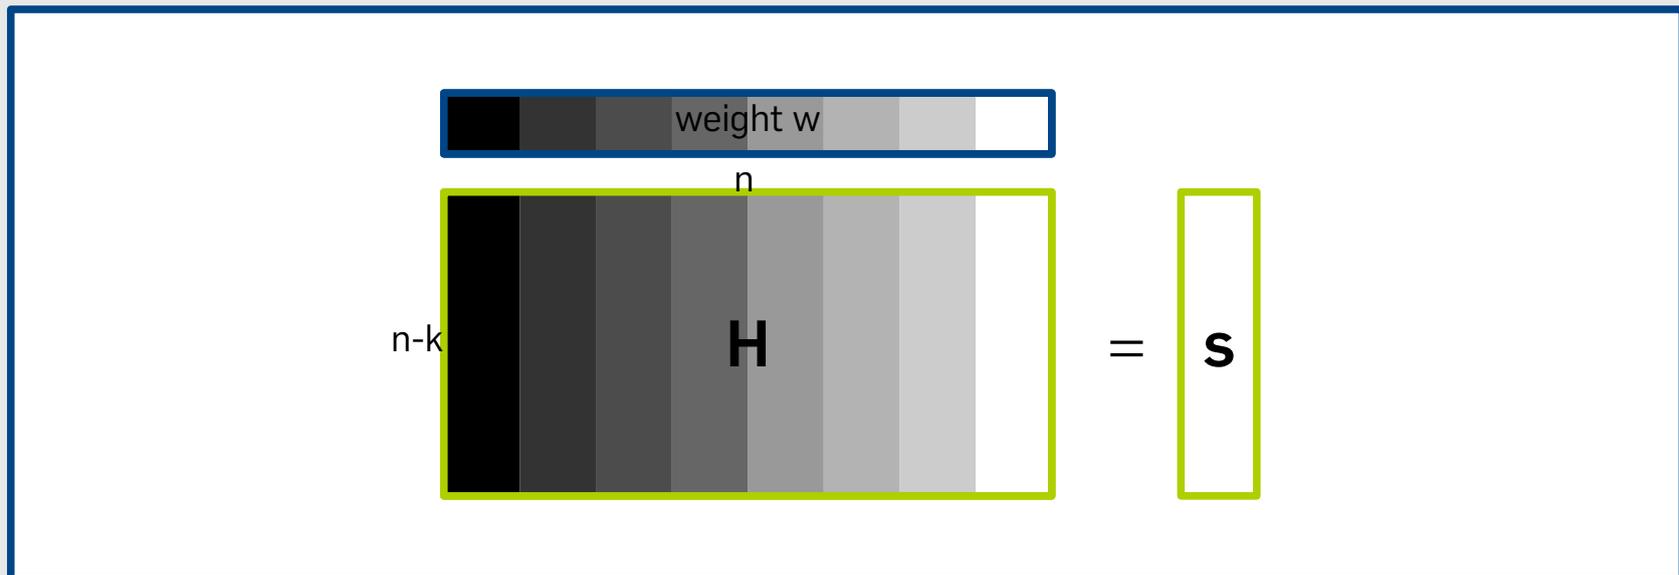

$$F(k) \leq 0.3868$$

## Allowed (linear algebra) transformations

- **Permuting the columns** of  $\mathbf{H}$  does not change the problem

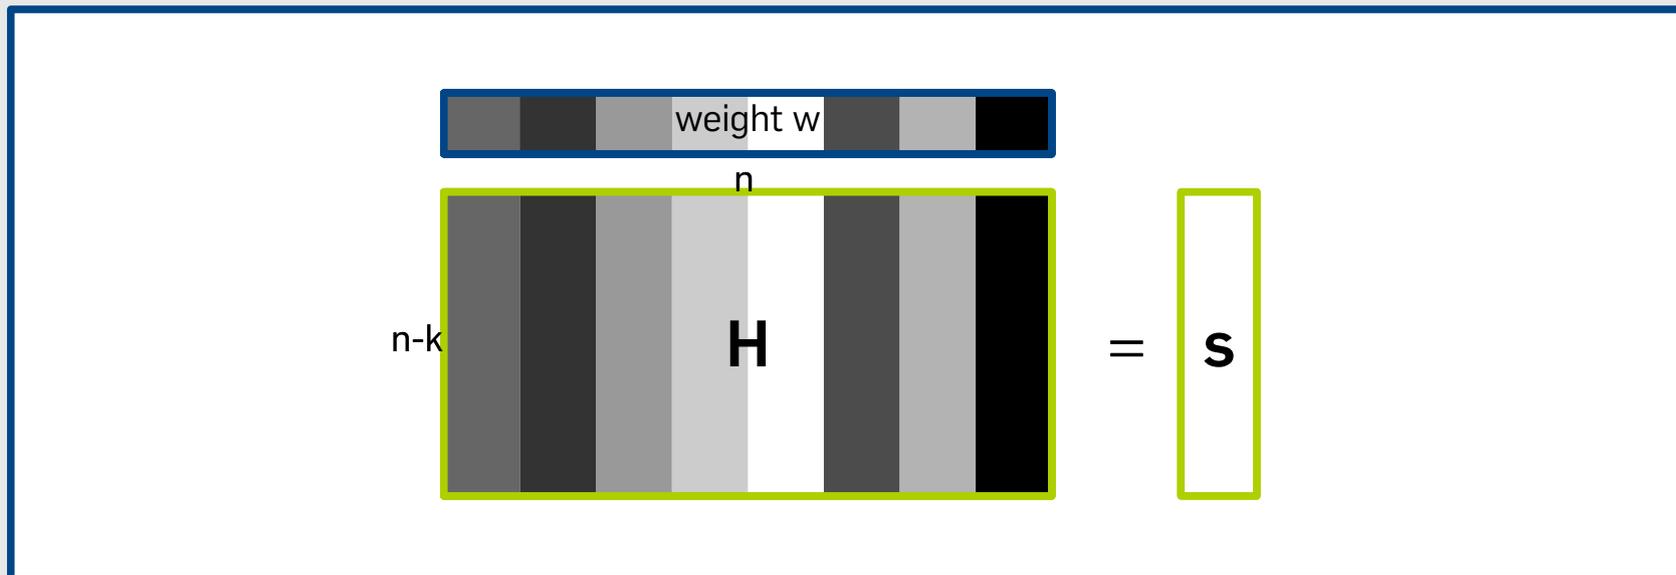

## Allowed (linear algebra) transformations

- **Permuting the columns** of **H** does not change the problem

## Allowed (linear algebra) transformations

- **Permuting the columns** of **H** does not change the problem

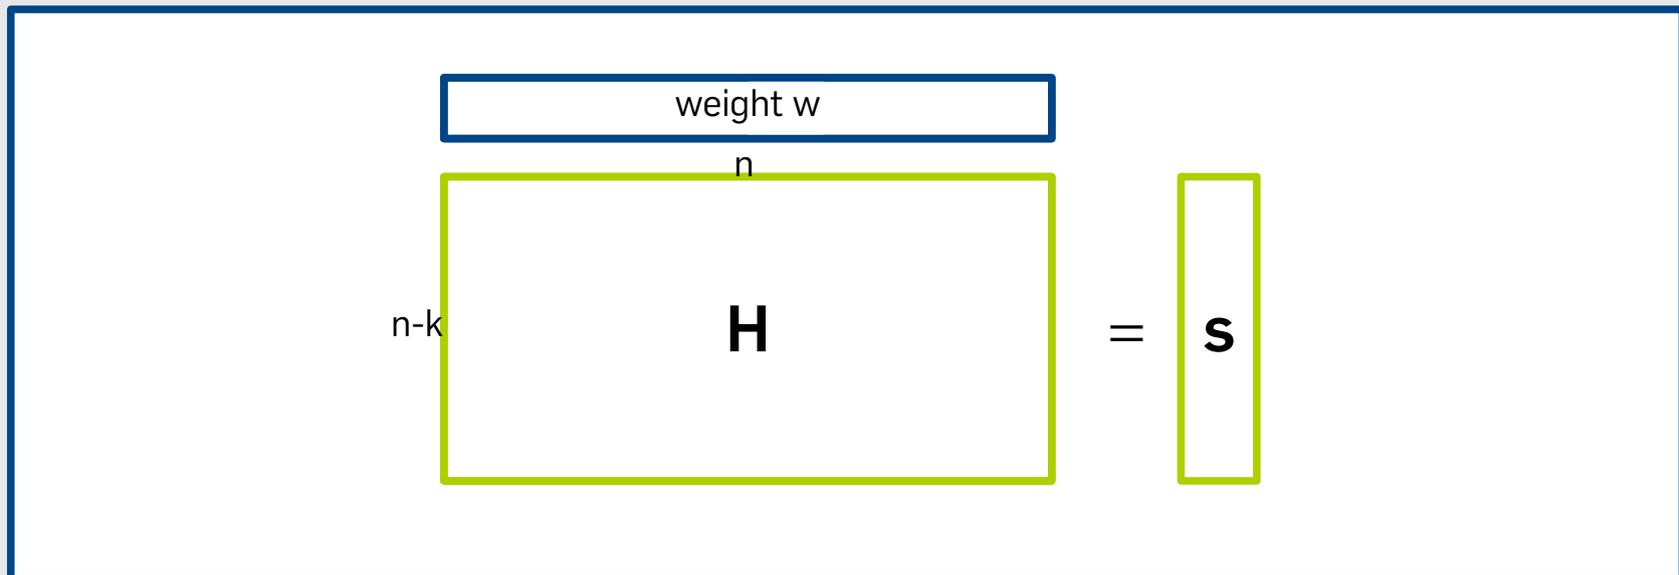

## Allowed (linear algebra) transformations

- **Permuting the columns** of  $\mathbf{H}$  does not change the problem
- **Elementary row operations** on  $\mathbf{H}$  do not change the problem

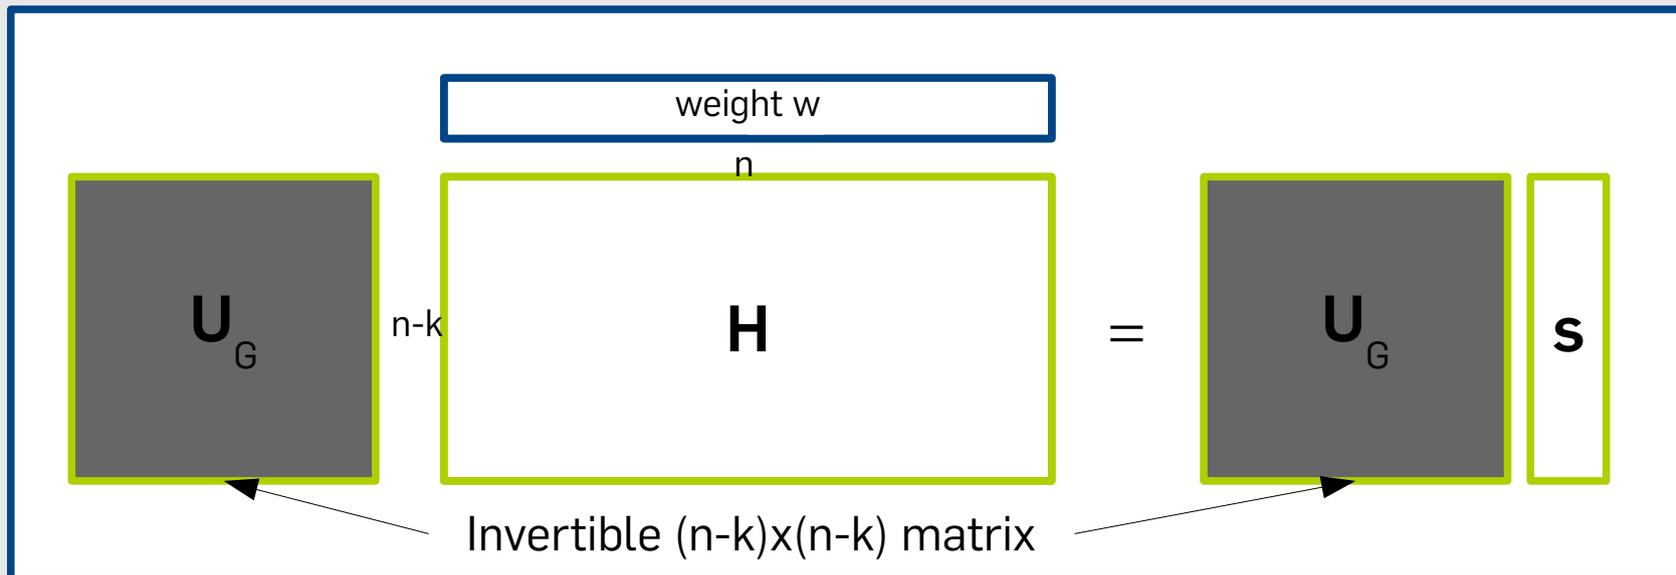

## Allowed (linear algebra) transformations

- **Permuting the columns** of  $\mathbf{H}$  does not change the problem
- **Elementary row operations** on  $\mathbf{H}$  do not change the problem

## Allowed (linear algebra) transformations

- **Permuting the columns** of  $\mathbf{H}$  does not change the problem
- **Elementary row operations** on  $\mathbf{H}$  do not change the problem

# Information Set Decoding

*"Reducing the brute-force search space by **linear algebra**."*

# The ISD Principle

- Structure of  $\mathbf{H}$  allows to divide  $\mathbf{e} = \begin{array}{|c|c|} \hline & \begin{array}{c} k+l \\ \mathbf{e}_1 \end{array} \\ \hline & \begin{array}{c} n-k-l \\ \mathbf{e}_2 \end{array} \\ \hline \end{array}$

- Haystack = set of all  $\overbrace{\hspace{1.5cm}}^{k+l}$   
 $\hspace{1.5cm} p/2 + \varepsilon$

- Needles =  $\underbrace{\binom{p}{p/2} \binom{k+l-p}{\varepsilon}}_{=:R}$  representations

How can we compute a  $1/R$  – fraction of the haystack ?

# How to use $1 + 1 = 0$

How can we compute a  $1/R$  – fraction of the haystack ?

- Want to find *one* needle  $I_1$  (and suitable  $I_2$ ) with

$$\sum_{i \in I_1} q_i = \sum_{j \in I_2} q_j + s$$

$q_1 + q_3 + q_4 + q_{11} = q_2 + q_4 + q_7 + q_{12} + s$

# How to use $1 + 1 = 0$

How can we compute a  $1/R$  – fraction of the haystack ?

Uniform 0/1 -  
coordinates

we need the needle  $I_1$  (and suitable  $I_2$ ) with

$$\sum_{i \in I_1} q_i = \sum_{j \in I_2} q_j + s$$

$$q_1 + q_3 + q_4 + q_{11} = q_2 + q_4 + q_7 + q_{12} + s$$

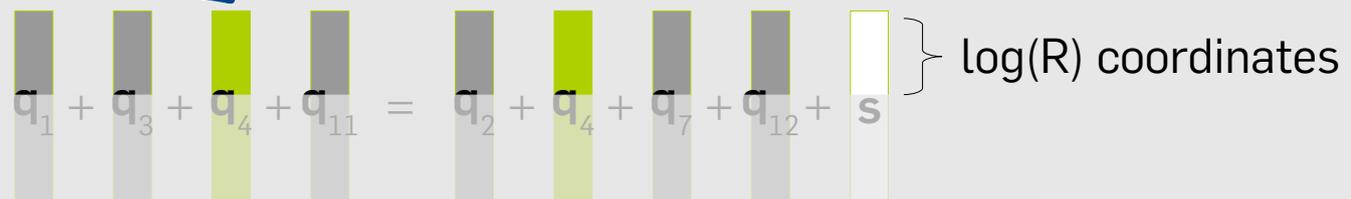

# How to use $1 + 1 = 0$

How can we compute a  $1/R$  – fraction of the haystack ?

Uniform 0/1 -  
coordinates

we need a needle  $I_1$  (and suitable  $I_2$ ) with

$$\sum_{i \in I_1} q_i = \sum_{j \in I_2} q_j + s$$

- Fix  $\sum_{i \in I_1} q_i$  to  $\mathbf{0}$  and  $\sum_{j \in I_2} q_j$  to  $\mathbf{s}$  on  $\log(R)$  coordinates

→ **Expect one needle to fulfill the extra constraint!**

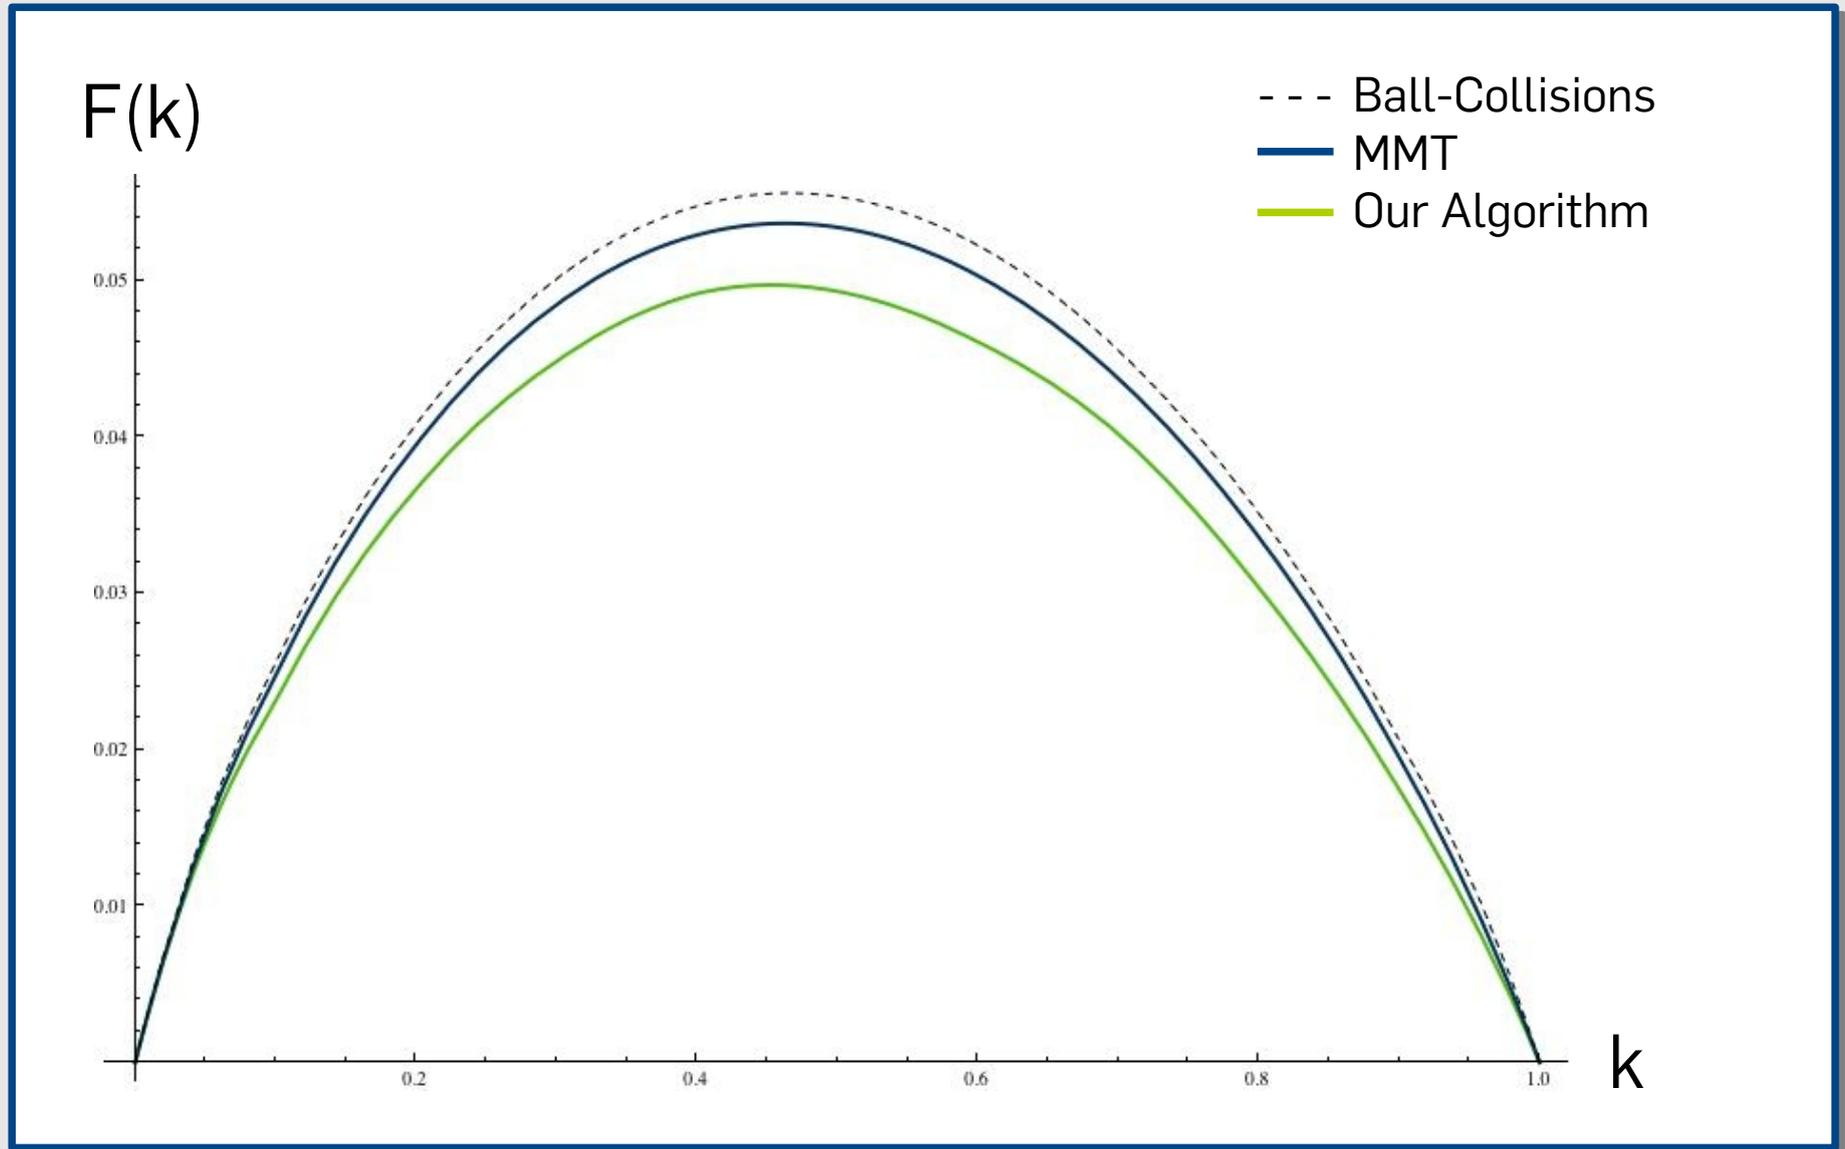

## The actual search for the needle

- à la Wagner's [Generalized Birthday Algorithm](#)
- [Three-layered](#) binary computation tree

## Some technicalities

- Need to exclude "[badly distributed](#)"  $q_1, \dots, q_{k+l}$
- Method introduces extra [inverse-polynomial](#) failure probability

# Main Result $F(k) \leq 0.04934 < 1/20$

## Summary

- Using  $1+1=0$  introduces extra representations
- *Asymptotically fastest* generic decoding algorithm
- *Full Version* ePrint 2012/026

## Open Questions

- More representations? Over  $\mathbb{F}_q$ ?
- (Low level) optimizations

## Summary

- Using  $1+1=0$  introduces extra representations
- Asymptotically fastest generic decoding algorithm

- Full Version ePrint 2012/026

**Thank you!**

## Open Questions

- More representations? Over  $\mathbb{F}_q$ ?
- (Low level) optimizations
