Embedding the UC Model into the IITM Model

Daniel Rausch, Ralf Küsters,
Céline Chevalier

EUROCRYPT 2022

Universal Composability

Widely used concept for defining and analyzing protocol security:

- Strong security guarantees
- Composability via composition theorems
 - ♦ Modular analysis
 - ♦ Re-use results

Universal Composability

Models for Universal Composability

Numerous models:

Models for Universal Composability

Numerous models:

Models for Universal Composability

Numerous models:

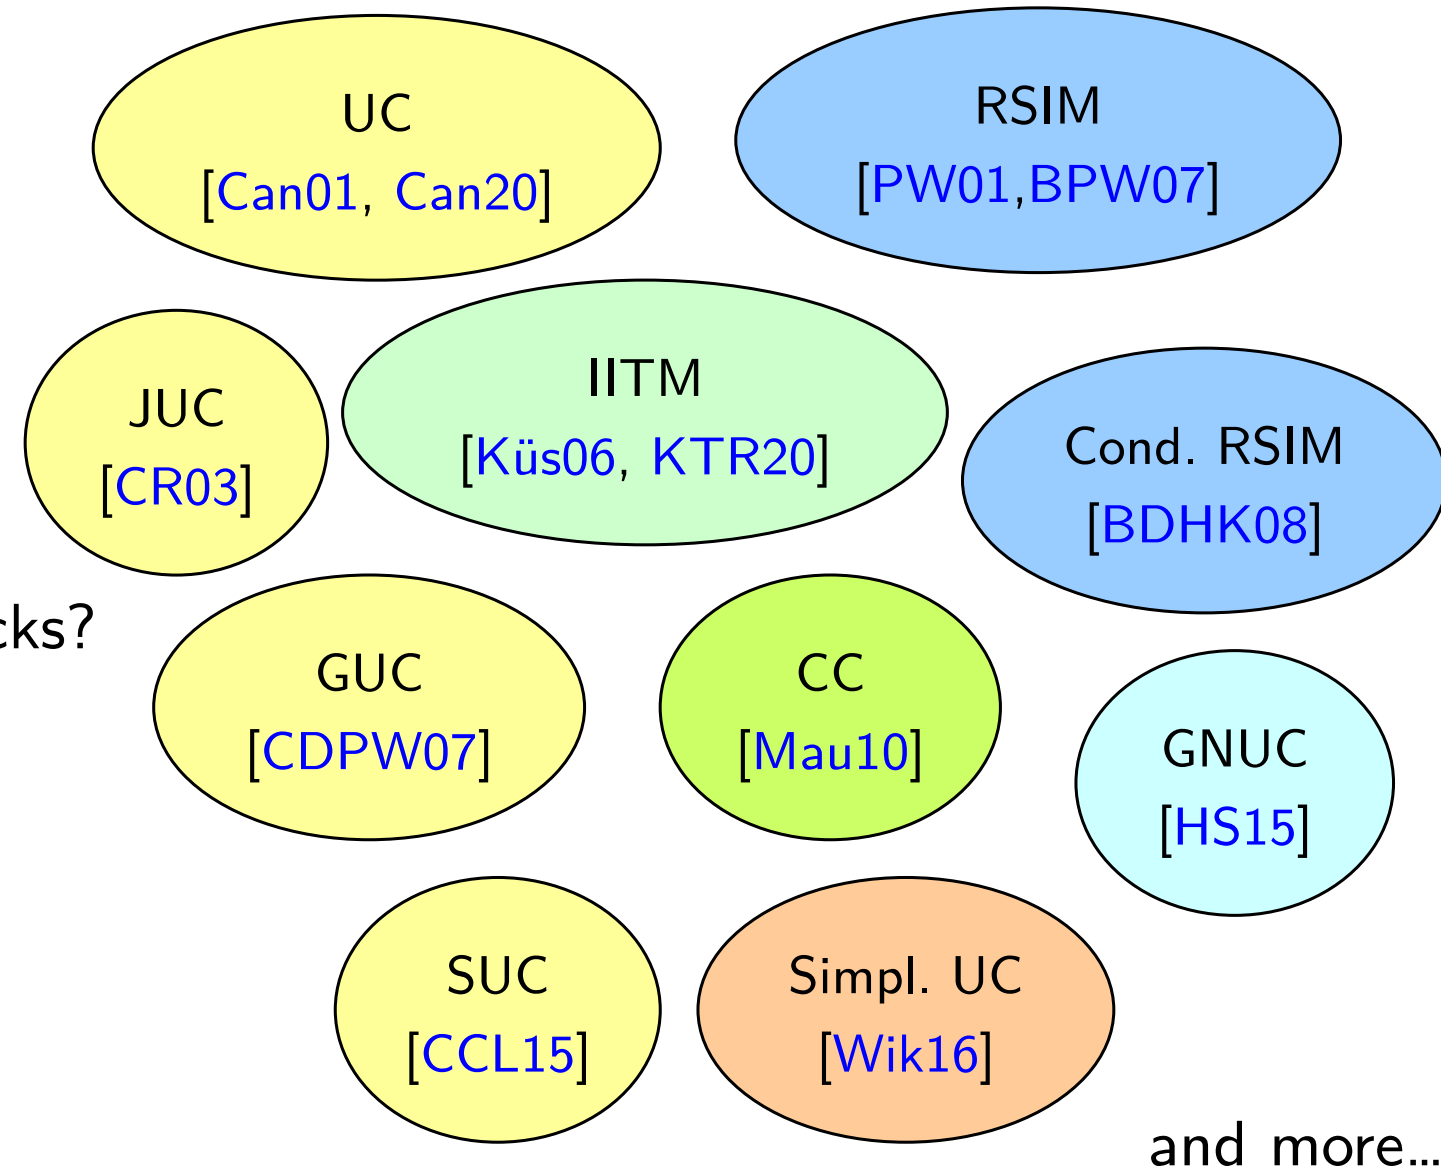

- Same basic idea but **differ drastically in technical implementation and features**

Models for Universal Composability

Numerous models:

- Same basic idea but **differ drastically in technical implementation and features**
- **Relationships so far unexplored:**
 - Expressiveness?
 - Strength of security results? Missed attacks?
 - Re-usability of results?

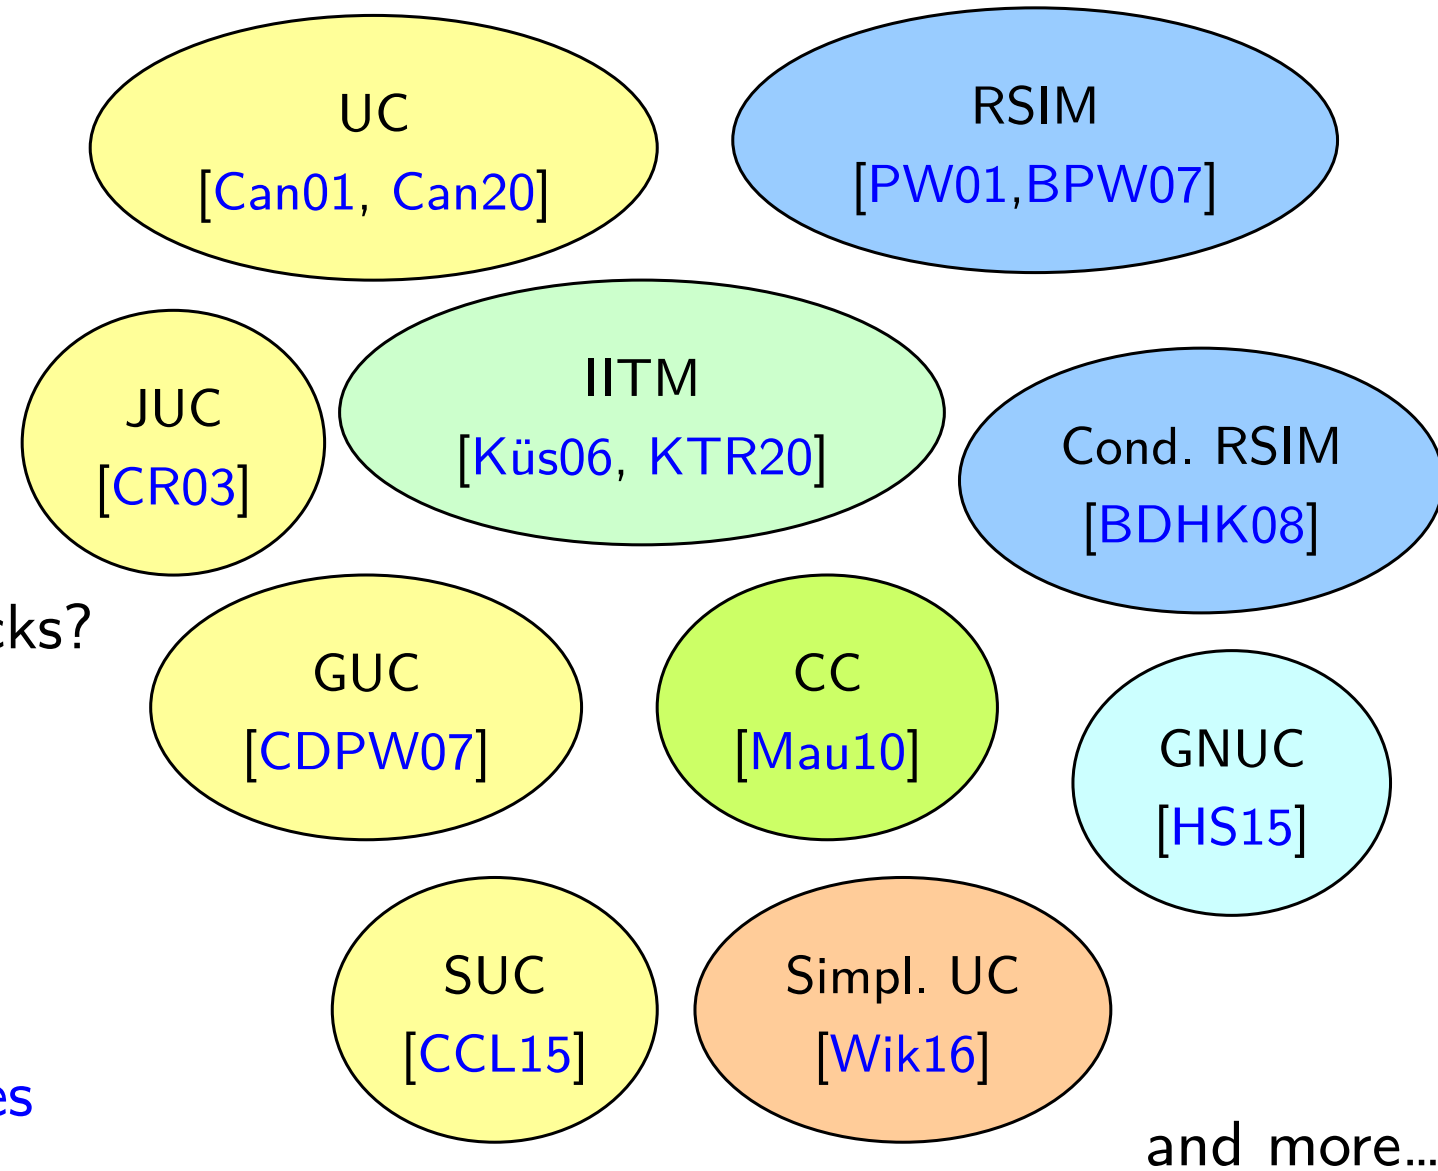

Models for Universal Composability

Numerous models:

- Same basic idea but **differ drastically in technical implementation and features**
- **Relationships so far unexplored:**
 - Expressiveness?
 - Strength of security results? Missed attacks?
 - Re-usability of results?

Our goal: Formally relate models

- **Educated choice of model**
- **Map and re-use protocols, results, features**
from one model to others

Why UC and IITM?

Why UC and IITM?

- Most commonly used
- Extensive literature: protocols and security results in a wide range of settings

Why UC and IITM?

- Most commonly used
- Extensive literature: protocols and security results in a wide range of settings
- Many interesting features, e.g., seamless support for protocols/composition with:
 - ♦ joint, global, arbitrarily shared state
 - ♦ globally shared SIDs, locally managed SIDs
 - ♦ combinations of all of the above

Why UC and IITM?

- Most commonly used
- Extensive literature: protocols and security results in a wide range of settings
- Many interesting features, e.g., seamless support for protocols/composition with:
 - ♦ joint, global, arbitrarily shared state
 - ♦ globally shared SIDs, locally managed SIDs
 - ♦ combinations of all of the above
- Has also been applied to protocols not yet captured in UC

- Relate different concepts
- Mapping from arbitrary UC protocols to IITM protocols
- Mapping preserves security and composability results

Overview of Our Contributions

Main contributions:

- Relate different concepts
- Mapping from arbitrary UC protocols to IITM protocols
- Mapping preserves security and composability results

Immediate practical benefit: Combine existing UC results with IITM features

Overview of Our Contributions

Main contributions:

- Relate different concepts
- Mapping from arbitrary UC protocols to IITM protocols
- Mapping preserves security and composability results
- Other direction is impossible in general

Immediate practical benefit: Combine existing UC results with IITM features

Overview of Our Contributions

Main contributions:

- Relate different concepts
- Mapping from arbitrary UC protocols to IITM protocols
- Mapping preserves security and composability results
- Other direction is impossible in general

Further results (details in the paper):

- Find and fix several issues in the UC model that formally prevent composition

Immediate practical benefit: Combine existing UC results with IITM features

Overview of Our Contributions

Main contributions:

- Relate different concepts
- Mapping from arbitrary UC protocols to IITM protocols
- Mapping preserves security and composability results
- Other direction is impossible in general

Further results (details in the paper):

- Find and fix several issues in the UC model that formally prevent composition
- Modeling technique for a new type of composition

Immediate practical benefit: Combine existing UC results with IITM features

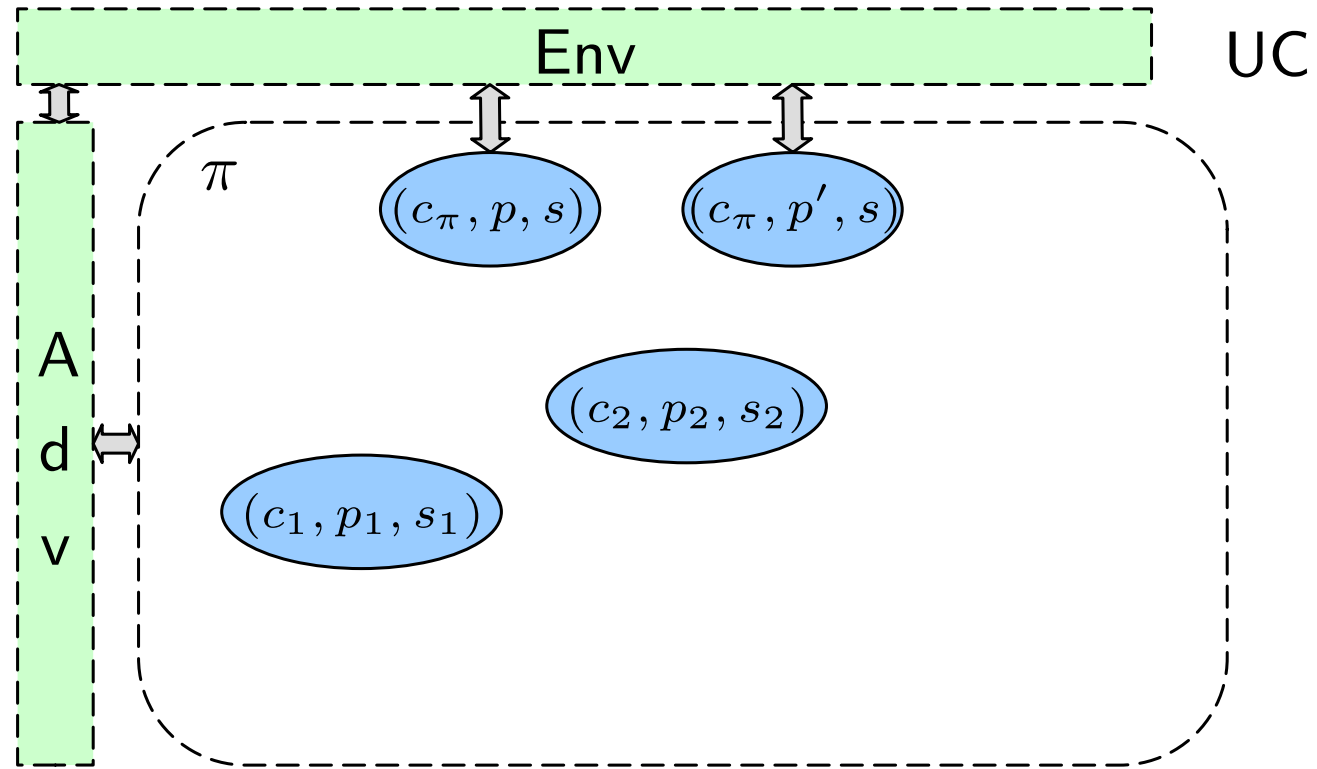

Main Contributions

- Concepts of UC and IITM
- Embedding UC into IITM

IITM Main Theorem:

Reconnect tapes

- ρ_{hl} only connects to external tapes of π/ϕ

Multi session setting: Includes protocols with
joint, shared, and global state as special cases

IITM Second Theorem:

- π/ϕ are **σ -session protocols**

Example: Composition

UC Theorem:

One protocol session

Shell code
redirects messages

\Rightarrow

\leq_{single}

Only for environments
that adhere to predicate ξ

- π/ϕ are **subroutine respecting**
- π/ϕ are **subroutine exposing**
- ρ is **compliant**

IITM Main Theorem:

Reconnect tapes

- ρ_{hl} only connects to external tapes of π/ϕ

Multi session setting: Includes protocols with
joint, shared, and global state as special cases

IITM Second Theorem:

- π/ϕ are **σ -session protocols**

Relationship?

Relationship?

Different...

- computational frameworks
- compositional statements
- classes of environments, adversaries/simulators, protocols

Relationship?

Different...

- computational frameworks
- compositional statements
- classes of environments, adversaries/simulators, protocols

How do models relate?

Are protocols and security results even comparable?

Main Contributions

- Concepts of UC and IITM
- Embedding UC into IITM
- The Other Direction

From UC to IITM Protocols

From UC to IITM Protocols

- All aspects of π_{UC} can be translated naturally to an IITM protocol, including dynamic code via Universal Turing machine.

From UC to IITM Protocols

- All aspects of π_{UC} can be translated naturally to an IITM protocol, including dynamic code via Universal Turing machine.
- π_{IITM} has to reveal (upper bound of) runtime tokens received so far to the adversary
→ Captures side channel provided by UC environments

From UC to IITM Protocols

- All aspects of π_{UC} can be translated naturally to an IITM protocol, including dynamic code via Universal Turing machine.
- π_{IITM} has to reveal (upper bound of) runtime tokens received so far to the adversary
→ Captures side channel provided by UC environments
- Variant $\pi_{IITM}^{\xi\text{-id}}$ that enforces a ξ bound on arbitrary environments

Preserving Security

Theorem:

$$\pi_{UC} \leq_{\text{single}, \xi} \phi_{UC}$$

Preserving Security

Theorem:

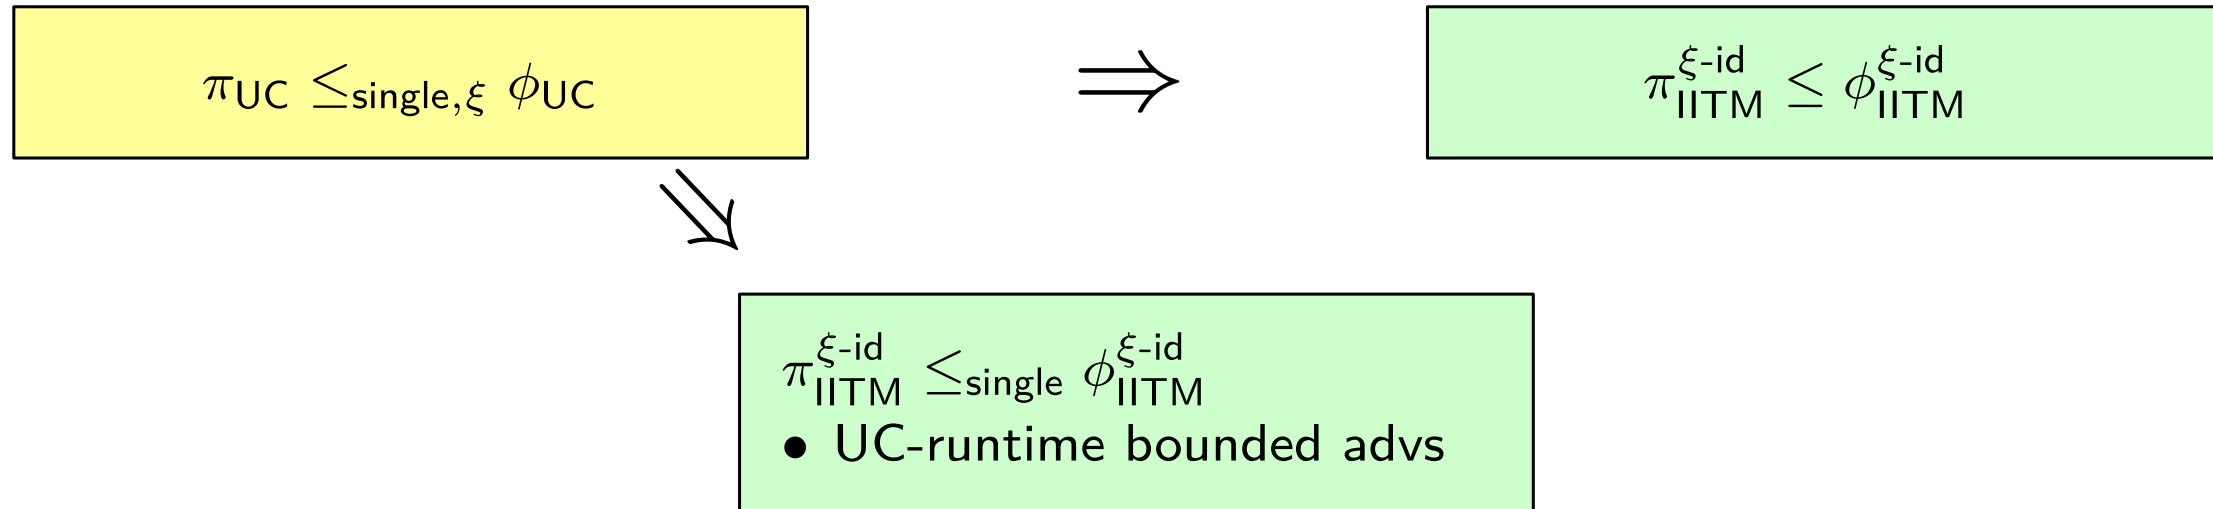

$$\pi_{\text{UC}} \leq_{\text{single}, \xi} \phi_{\text{UC}}$$

$$\pi_{\text{IITM}}^{\xi\text{-id}} \leq \phi_{\text{IITM}}^{\xi\text{-id}}$$

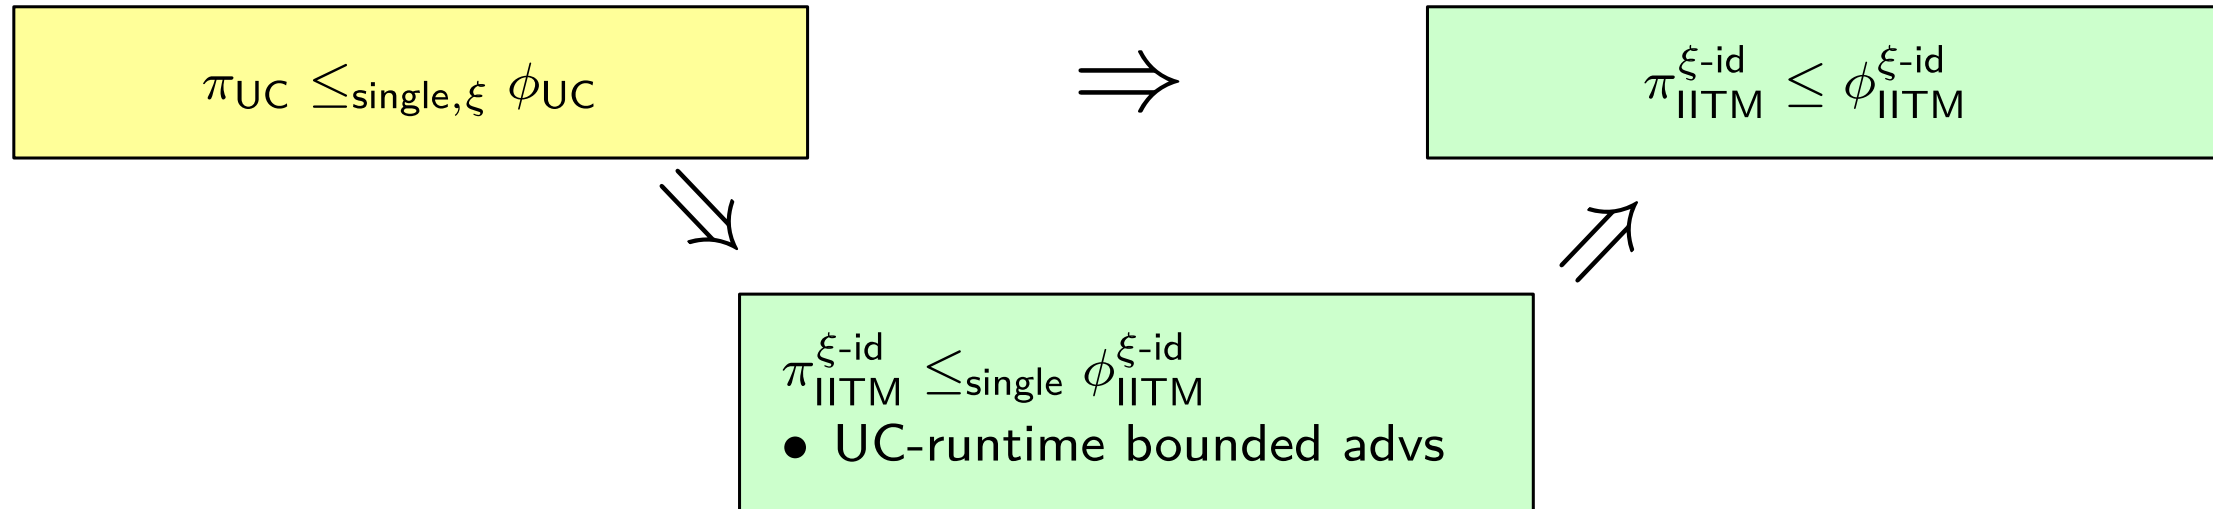

Preserving Security

Theorem:

Main Contributions

- Concepts of UC and IITM
- Embedding UC into IITM
- The Other Direction

From IITM to UC

The other direction is impossible in general:

From IITM to UC

The other direction is impossible in general:

- [KTR20]: There are natural protocols that meet the IITM but not UC runtime notion

From IITM to UC

The other direction is impossible in general:

- [KTR20]: There are natural protocols that meet the IITM but not UC runtime notion
- Impossibility result due to simulator classes

From IITM to UC

The other direction is impossible in general:

- [KTR20]: There are natural protocols that meet the IITM but not UC runtime notion
- Impossibility result due to simulator classes
- UC protocols must provide an oracle that reveals existence of instances to adversary
 - Changes security properties

Conclusion

Our work clarifies relationship UC - IITM:

Conclusion

Our work clarifies relationship UC - IITM:

- All UC protocols and results carry over to the IITM Model

Conclusion

Our work clarifies relationship UC - IITM:

- All UC protocols and results carry over to the IITM Model

Existing UC results can benefit from IITM features such as

- joint, global, arbitrarily shared state
- locally managed SIDs
- larger classes of simulators and protocols
- combinations of the above

Conclusion

Our work clarifies relationship UC - IITM:

- All UC protocols and results carry over to the IITM Model

Existing UC results can benefit from IITM features such as

- joint, global, arbitrarily shared state
